

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

XIV. A Letter from the Rev. Henry Miles, D.D. and F.R.S. to Henry Baker, F.R.S. concerning an Aurora Borealis feen Jan. 23. 1750-51.

Dear Sir,

Read Feb. 22. N Tuesday, 23d of January last, I was called out, about Six in the Evening, to see a strange Appearance in the Sky, in the West. Suspecting it to be an ordinary Aurora, I did not make great Haste-When I came out, I saw a Cloud (not large) of an obscure red Colour, but much deeper than any I had ever feen before, which, I was informed, rose from the S. W. it was then advancing apace to the N. E. and quickly reached the Zenith, when, it being intercepted by the House, I hastened to the other Front, which regards the NE. by which time there appeared a luminous Zone, about the Breadth of the Galaxy, its Edges regularly defined, compassing the Hemisphere, from the Horizon in the N. E. to the Zenith, in the same Direction, in which the above-mentioned Cloud had passed (as far as I faw its Course) from the S. W. The Colour was much fainter, and more luminous, resembling the usual Colour of an Aurora, and the Lamina or Streamers foon appeared—upon this, not being well fenced against the Wind, which blew brisk, I went in, to pursue my Intention of viewing the two beautiful Planets, Jupiter and Venus, with a reflecting Telescope, made by my ingenious Friend Mr. Short of Surrey-street (the greatest magnifying Power of which is about 200 Times); and after I had viewed

## [ 347 ]

viewed them to my Satisfaction, and shewed them to some Friends, when I was about to put up the Instrument, a Cloud, of near the Size of the first. but not so deep a Colour, appeared, rising up from the S. W. which proceeded in a Line with the Planets, and, in a little time, furrounded both: Venus appearing still, to the naked Eye, in her full Lustre, I immediately viewed her with the Telescope, without altering the Focus, and faw her much more diffinctly than ever I had done, on that Evening, or on any other, and of the same Opinion were all my Friends as to the Sight they had of her, on that Occasion: We all faw her Spots plain, resembling those in the Moon; which I was never so happy as to have a Sight of before—and this, while the Cloud feemed to furround it, as much as ever: But whether the Vapour might be really rarer near the Planet, than it was at some Distance, no Judgment could be made. because of her too powerful Light.

Many have observed the fixed Stars to appear thro' the Vapour with an undiminished Light oftentimes: And our great Dr. Halley tells us, in his Account of that remarkable Aurora, which was seen in March, 1715-16. that he observed "one of the Lamina" pass successively over all the Stars of the litte Bear, "without effacing the smaller ones, in the Tail, of "the fifth Magnitude; such was the extreme Rarity and Perspicuity of the Matter whereof it consisted." Phil. Trans. No 347.

I had the Honour this Week to receive a Letter from Dr. Short of Sheffield, the Author of an Account of several Meteors, in the Phil. Trans. N° 459. in which he says, "The 23d past, at Six at Night, the

"Sky being overclouded, all the Clouds over the "Hemisphere, turned of a sudden to a deep blood-"red Colour, for fifteen Minutes; then succeeded red

" Streamers for half an Hour."

Tooting, Feb. 16. 1749-50. I am your, and the
Royal Society's,
most obedient Servant,

H. MILES.

XV. A Letter from Mr. William Watson, F.R.S. to the Royal Society, declaring that he as well as many others have not been able to make Odours pass thro' Glass by means of Electricity; and giving a particular Account of Professor Bose at Wittemberg his Experiment of Beatistication, or causing a Glory to appear round a Man's Head by Electricity.

GENTLEMEN,

Properties of Electricity has been, within these few Years, the Pursuit of many excellent and ingenious Persons; and most of its extraordinary Phænomena, which have been made to appear in one Place, have, with proper Attention to the requisite Circumstances, appeared in others: But there
